

Under Vehicle Surveillance System

'With the increasing awareness of global security threats, organizations around the world are repositioning their security measures and are investing more resources in advance technological security surveillance systems to boost security operations.'

Benefits

- No traffic disruption
- A complete undercarriage image is displayed for easy inspection
- Fast and effective compared to conventional mirror search
- 1 Operator is required only
- Long term cost savings

Specially designed for:

- Police Units
- Defence Units
- Embassies and Consulates
- Custom Checkpoints
- Prisons
- Parliament Houses
- Courts
- Airports and Seaports
- Water and Energy Plants
- Petroleum Plants
- Commercial Buildings Protection
- Hotels
- Banks

UV2 - Under Vehicle Surveillance

System is a video surveillance system specially designed for security professionals to scrutinize the undercarriage of all vehicles. The system equips fast and effective means for the security officers to examine moving vehicles without causing any great disturbance to the traffic flow.

Observation Unit

Application

UV2 is specially designed for deployment at crucial point of entry to vital premises or buildings. Security officers can conduct a fast and thorough inspection of all vehicles' undercarriages for illegal attached packages and smuggled items like dangerous explosives, weapons, drugs and contrabands.

The System

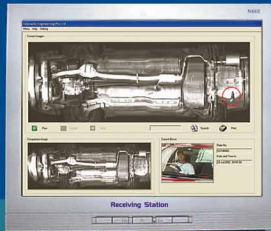

The system comprises of an Observation Unit and a Receiving Station. The weatherproof Observation Unit acts as a protective enclosure to the camera(s) and halogen lights. The unit scans any width and length of any vehicle passing through the system.

The Receiving Station is complete with a processor and LCD monitor. Upon activation, the undercarriage images will be transmitted to the receiving end for displaying. The interface software allows easy reviewing, recording, and managing of the images. A complete perspective of the undercarriage image displayed on the screen aids security officers to conduct rapid and detailed examination of the vehicle.

Automatic license plate recognition software can be incorporated to recognize and collect a database of the vehicle license plate numbers and the facial image of drivers (optional feature - additional camera required).

UV2 provides a comprehensive control and monitoring of vehicles entering or leaving the premises.
